What I did

I have completed all path-related work. My code and the datasets used are located in the `python_codes` folder.

I am continuing with the data cleaning tasks. All data has now been fully integrated.

I am still learning how to use the new referencing method and the new approach to creating slides.

Plan for next week

- This slide has R code in it

```
x <- 2+2  
y <- 6*x  
x
```

```
## [1] 4
```

```
y
```

```
## [1] 24
```

Third slide

- New slide with image in Figure 1.
- You can put a label on the image so that you can refer to it in the text.

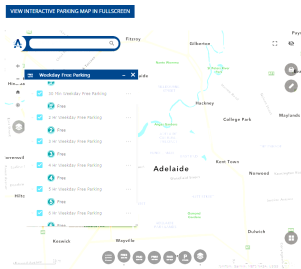

Figure 1: T-Rex picture. Source Wikipedia:

https://commons.wikimedia.org/wiki/File:Tyrannosaurus_Rex_colored.png

- See the Rmd file for how this was done. All the options might be a bit confusing, so just ask me about it if you want some help to decipher it.

Changing themes

- Here is a list of themes that you can use if you don't like the one in this template: https://deic.uab.cat/~iblanes/beamer_gallery/index_by_theme_and_color.html.
- Just change the words in the “theme” and “colourtheme” parts of the YAML.

Some fancy things

- You can progressively reveal parts of the slide with the `\pause` command.

Some fancy things

- You can progressively reveal parts of the slide with the `\pause` command.
- Eg. this line used a `\pause`

Some fancy things

- You can progressively reveal parts of the slide with the `\pause` command.
- Eg. this line used a `\pause`
- Eg. so did this line

Some fancy things

- You can progressively reveal parts of the slide with the `\pause` command.
- Eg. this line used a `\pause`
- Eg. so did this line
- Use the “Presentation mode” in the RStudio viewer (button in the top-right of viewer screen) to preview what it will look like in full screen mode.

Some fancy things

- You can increase or decrease the size of a piece of text with `<size command> blah blah blah`.
- Eg. Here I have used `\Large`, now I have changed back to normal and here I have used `\scriptsize`.
- Here's a list of possible sizes (in order):

`\TINY, \Tiny, \tiny, \scriptsize, \footnotesize, \small, \normalsize`
(default), `\large, \Large, \LARGE, \huge, \Huge`

Some fancy things

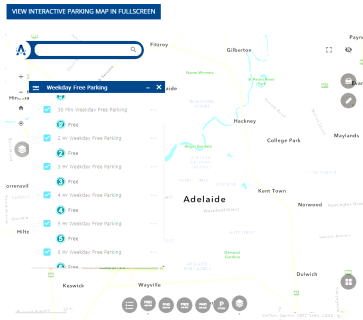

Figure 2: T-Rex picture again. Source Wikipedia:
https://commons.wikimedia.org/wiki/File:Tyrannosaurus_Rex_colored.png

- If you want to present a diagram next to some text, you can use a `minipage`.
- You can adjust the `<number>\textwidth` in the `\begin{minipage}` command for each minipage.
- This will increase or decrease the widths of each page.
- Be careful not to make the widths of minipages too wide, otherwise the text will flow off the page.

Some fancy things

- An example of setting the minipage widths too wide.

- Text flowing off the page because the minipage widths are too wide.

https://commons.wikimedia.org/wiki/File:Tyrannosaurus_Rex_colored.png

Some fancy things

- You can combine `\pause` with `minipage`

Some fancy things

- You can combine `\pause` with `minipage`
- Like this line and the diagram to the right
